

a Distil each source into a structure-to-response map

Source targets are computed quantities or empirical measurements

b Learn the endpoint separately

Experimental hydration labels supervise the endpoint, not its source targets

c Distinguish endpoint exclusion from source exclusion

85 ARROW molecules

Absent from all six supervised sources

Each hydration prediction is out of fold:
its label is excluded from that endpoint fit.

220 external molecules

All absent from endpoint training

123 source-exposed

97 absent from all six

97 is a subset of 220, not a separate fit.
