

a Many conformers, one equilibrium hydration target

b Summarize the supplied ensembles

$$g_i = G_i - \min_j G_j$$

$$C = -RT \ln \sum_i e^{-g_i/RT}$$

c Predict six summaries from molecular structure

C_{gas}	C_{water}	$\Delta G_{\text{ensemble}} - s_{i_0}$	$\text{SD}(s_i)$	$\text{mean}(\Delta g_i)$	$\text{SD}(\Delta g_i)$
Gas ensemble	Water ensemble	Hydration correction	Solvation spread	Mean water response	Response spread

s_i : conformer solvation energy; i_0 : lowest-gas-energy conformer.

$\Delta g_i = g_i^{\text{water}} - g_i^{\text{gas}}$. Each phase uses its own energy minimum.
